STATE OF NORTH CAROLINA

James B. Hunt, Jr., Governor

OFFICE OF STATE BUDGET AND MANAGEMENT

John A. Williams, Jr.
Executive Assistant to the Governor
and State Budget Officer

Marvin K. Dorman, Jr.
Deputy State Budget Officer

The North Carolina Population Projections have been prepared under the direction of Dr. Gregory Williams, State Demographer, by the Research and Planning Services Section. Mr. Bill Tillman provided computer programming assistance to produce the state and county projections as well as many program modifications particular to this current round of projections. Users interested in accessing the data in machine readable form or in obtaining county level detailed projections should contact Mr. Tillman for assistance. Comments and/or assistance were provided by Ms. Karan Bunn, Director of Research, and Ms. Sharon Rains. Typing and layout assistance were provided by Ms. Norma Rotkopf.

Additional copies of this document can be obtained by writing the Librarian, Office of State Budget and Management, 116 West Jones Street, Raleigh, North Carolina 27611. Cost per copy is $5.00 plus tax. (Tax rate: Wake County 4½%, all other counties in North Carolina 3%, out of state orders pay no North Carolina sales tax.) Make checks payable to Office of State Budget and Management. No C.O.D. or invoice billing accepted.

INTRODUCTION

This report presents population estimates and projections for the State of North Carolina and its counties by age, race and sex. Estimates are presented for July 1, 1981 and 1982 and projections are presented for the period 1983 - 2000. While county populations are projected for 1983, the state total for 1983 is a provisional estimate. An estimate is distinguished from a projection in that current data indicative of population change are available for the year of an estimate, while they are not available for a projection year. These projections supersede those published in Update: North Carolina Population Projections, July 1981. The current round of projections is consistent with data released in unpublished form in 1983 and has been updated to include provisional county and final state estimates for 1981 and 1982, as well as provisional state estimates for 1983. These were produced by the Federal-State Cooperative Program for Population Estimates in early 1984. The county estimates published here will not agree with those currently being released by the Census Bureau in their P-26 County Population Estimates Series. The Bureau's estimates are controlled to a preliminary state total whereas these estimates have been controlled to the final state estimates for 1981 and 1982 as published in the Census Bureau's P-26 State Population Estimates Series. The county estimates for 1981 and 1982 presented here should be consistent with those published in next year's Census Bureau P-26 County Population Estimates publication.

A detailed description of the 1983 methodology and all pertinent data series used are documented in the text of this report. Current projections of fertility and mortality developed after the 1980 Census have been included. All available age, race, and sex detail from the 1980 Census have also been incorporated and are consistent with published data. Minor corrections have been released since the publication of the 1980 Census reports, including Forsyth (243,704), Pender (22,262), Randolph (91,300), and Union (70,436) counties. Major methodological differences incorporated in the current projections series include: adjustment of the 1970 and 1980 census data for undercount to develop state level migration rates, the control of county projections to an independent state control, and improvements in the methods to more adequately project for counties with significant group quarters populations. Most major changes observed in this set of projections were a result of the use of 1980 Census statistics and more current birth and death data. Consequently, this series employs a continuation of more current county migration patterns by age, race and sex and updated fertility and mortality assumptions for future years. The combined effect of changes in methodology and new data series produces projections which differ more from the series published in 1981 then previous updates of the projections.

As we move through the 1980's decade, each new projections series will continue to reflect methodological and data changes for the purpose of improving these projections. Each new update which will be released during the 1980's will place greater emphasis on migration patterns reported during the current decade. Trends in the age, race, sex detail will continue to rely primarily on 1970-80 patterns.

TRENDS IN STATE POPULATION

TRENDS IN STATE POPULATION

POPULATION SIZE AND GROWTH

On July 1, 1982, the population of North Carolina was estimated to be 6,019,406, representing an average annual rate of increase of 1.0% per year since 1980. This is slightly slower than the annual rate of growth of the 1970's, primarily due to the decline in fertility. Through much of its history, North Carolina grew more slowly than the nation as a whole, largely due to out-migration of its citizens to the North and West. Since the 1960's, the growth of new industry and the general attraction of the "sun-belt" states reversed this trend in out-migration, changing a net loss of migrants to a positive gain. While the pace of growth for North Carolina and the nation has slowed with declining fertility since the late 1960's, this series of projections suggests a continuation of North Carolina's positive relative growth, still outpacing the nation.

Against this historical backdrop, the projection series presented in this report shows that North Carolina will continue to add a substantial number of people during the remainder of this century. By 1990, the total population is projected to be close to 6.5 million and should exceed 7 million by the turn of the century. Further, depending on general trends in the national economy and a continuation of the recent relative economic position of the state, North Carolina could grow by more than this series of projections suggests. It is unlikely, however, given low national and state fertility rates, that population growth would reach the high rates experienced during the 1960's.

TABLE 1 Average Annual Growth Rates for North Carolina and the United States, 1950-2000

	1950-60	1960-70	1970-80	1980-90	1990-2000
North Carolina	1.15	1.39*	1.16*	0.99	0.76
United States	1.73	1.25*	1.08*	0.95	0.71

* Rates based on 1970 census adjusted for undercount.

North Carolina's total population has undergone substantial growth and change since 1950. The overall population change as well as trends in specific age groups are shown in Table 2 and Figure 1.

AGE COMPOSITION

Trends in population growth for various age groups differ substantially from that of the population as a whole. This is due to differences in fertility and mortality trends, as well as variations in migration trends by age. Throughout the nation, fertility has been on the decline. During the remainder of this century, this decline will have a substantial impact on the size of the younger cohorts.

In North Carolina, the number of children under 5 is expected to increase by 8.2% (33,100 persons) during the 1980's, as the "baby boom" generation passes through its peak childbearing years. The 1990's, however, should see a decline of about 24,000 (-5.4%) in the under 5 population, as smaller cohorts begin to dominate the key childbearing age groups.

The population 5-13, those persons of elementary and junior high school age, are expected to undergo a decline during the 1980's (-6.1% or 51,000 persons); but, this age group should increase in size during the 1990's by about 26,000 (3.3%), as the children born in the 1980's reach school age.

During the 1980's, persons 14-17 or those of approximately high school age will undergo a slightly larger numerical and proportional decline (-13.3% or 56,000 persons) than experienced by the 5-13 year old group. This age group should remain stable during the 1990's.

The most dramatic decline among all age groups during the 1980's will occur in the 18-24 year olds, those persons entering the labor force for the first time, entering college, or beginning to form new households and families. During the 1980's, this age group should decline by 11.3% or some 92,600 persons. This decline should continue into the 1990's with a further loss of 64,700 or 8.9%. These declines are primarily the result of the last segments of the "baby boom" cohort passing through this age group.

The population 25-34 should increase during the 1980's by 13.2% or 127,000 persons. This increase in the young adults, the primary ages for family and household formation, should be temporary and decline again by 120,000 or 11.0% during the 1990's.

While projected losses dominate the younger age groups, all age groups over 35 show substantial increases during the 1980's and 1990's. The largest proportional increases during the 1980's will occur in the 35-44 year old age group which should grow by 322,800 or 47.3% during the decade. This growth is due to not only the aging of the "baby boom", but also to net in-migration of adults over 35 to North Carolina. This age group is expected to continue to grow during the 1990's at a slower rate, with a gain of 131,200 or 13.0%.

The number of persons 45-54 is also expected to grow during the remainder of the century. This age group is expected to increase by 104,500 or 17.4% during the 1980's and by 315,000 or 44.7% during the 1990's, as those born after World War II begin to reach this age category.

More modest increases are expected among persons 55-64 during the next 20 years. The 1980's should bring an increase of only 37,400 or 6.8% in these ages, with larger increases in the 1990's of 99,600 or 16.9% among the pre-retirement cohorts.

The population over 65 is expected to continue to grow rapidly in North Carolina for the remainder of the century. During the 1980's, we expect a gain of 185,800 for a 30.8% increase in older adults. During the 1990's, this population should continue to grow by 149,400 or 18.9% reflecting increased life expectancies and a continued interest in North Carolina as an attractive place for retirement.

Overall, the general aging of the population plus in-migration of middle aged workers and retirement age population dominate the character of projected growth of the state during the next twenty years.

RACE AND SEX COMPOSITION

The 1980 Census showed that 1,424,259 or 24.2% of the population of North Carolina was classified as some race other than white. Of this nonwhite group, 92.6% or 1,318,857 listed their race as Black; 4.5% or 64,536 were listed as American Indian; and, the remainder was composed of a variety of other racial groups. Census categories for classifying race changed slightly between 1970 and 1980, making exact comparisons between censuses difficult. However, these changes had only a minor impact on the number or proportion of nonwhites between the two censuses in North Carolina. Users who need to assess the exact impact of this change should consult the Users Guide to the 1980 Census to determine historical comparability.

Continuing the trend of the last ten years, the population made up of races other than white is expected to grow more rapidly than the white population. The population other than white is expected to increase to 1,715,600 (26.4%) by 1990 and to 1,954,600 (27.9%) by the turn of the century.

Like the nation as a whole, North Carolina's overall population is composed of slightly more women than men. In 1980, women made up 51.5% of the state's population, while comprising 60.8% of the population over 65, due to their greater life expectancy. The sex composition of North Carolina's population is expected to remain stable as we approach the next century. In the year 2000, the overall proportion of women in the population is projected to remain at 51.5%, with 60.6% of the population over 65 being female.

METHODOLOGY AND ASSUMPTIONS

METHODOLOGY AND ASSUMPTIONS

OVERVIEW

The methodology used to produce the state and county population projections was based on several general assumptions about population change.

* Population in future decades will be a function of the aging of the 1980 population base, changes in fertility behavior and survival rates, and trends in migration as reflected in the 1970's.

* Migration trends within North Carolina during the 1970's were overstated due to an undercount of about three percent in the 1970 census.

* It is assumed that state level migration will reflect a continuation of 1970-80 migration trends (adjusted for undercount) by specific age, race and sex groups at the state level. County migration patterns reflect the county's share of state migration during the prior decade.

* Except for adjustments in fertility and survival rates, changes in the age, race and sex structure of each county will mirror the 1970-80 decade experience, except as controlled to an anticipated level of total migration for the state.

* Counties with significant group quarters population (such as military bases, universities, prisons, etc.), whose age structure remains relatively stable over time, would not experience the traditional aging of the population for some proportion of the age groups influenced by these group quarters.

To incorporate these assumptions, counties were projected based on the Hamilton-Perry technique detailed later in this section, using unadjusted Census counts. Counties with significant group quarters population, whose age structure differed from an average state profile for counties without significant group quarters, were projected using a combination of age group and cohort interpolation. The state's population (adjusted for 1970 and 1980 undercount) was independently projected based on the aging of the population base, current fertility and survival rate assumptions and 1970-80 trends in migration by 5-year age, race and sex groups. Adjustments to the county projections to force them to sum to the state were made proportional to the implied level of migration in each county.

BASIC TREND PROJECTIONS BY COUNTY

The basic county trend projections by age, race and sex were generated using a modified ratio projection procedure developed by C. Horace Hamilton and Josef Perry. This technique compares the count of individuals in a five year age group in 1980 (for example, white females 20-24) to the same group of individuals as counted in the 1970 Census (those white females 10-14). The ratio of the two counts is expected to remain about the same between 1980 and 1990 as experienced in the past decade. The basic trend procedure combines the effects of migration and mortality for each age, race, sex group. Slight adjustments are made for assumed increases in the survival rates. Projections of the youngest age groups, which were not born at the time of the 1980 census, are based on assumed fertility rates through 1990 and on the number of women of childbearing age. These basic projections represent the population that would exist in 1990 if 1970-80 trends, adjusted only for changes in fertility and death rates, were to continue in each county.

While the "Hamilton-Perry" projections form the base of the projections process, they have been modified for the growth of certain institutional populations and for an anticipated level of migration for the state as a whole. These assumptions and modifications are discussed in more detail in the next two sections.

ASSUMPTIONS REGARDING INSTITUTIONAL POPULATION GROWTH

In general, institutions such as colleges and universities, military installations and, to a somewhat lesser extent, prisons and some state hospitals house persons of a particular age, race, or sex group. These institutions tend to be characterized by high levels of in- and out-migration. The populations of these institutions generally do not age in the traditional way, but are replaced by other persons of a similar age. These populations will thus grow not so much according to demographic processes but more through institutional and government policy changes. For example, counties with a major university, drawing from the population both in and outside the state, will maintain a relatively constant proportion of their population in the 18-24 age group while the remainder of the county ages normally. Adjustments to the basic trend projections have been made to account for these institutional effects in various counties. To estimate these effects, the age, race, and sex composition of counties with large institutional populations was compared to the age, race, and sex composition of predominantly noninstitutional counties. The proportion of an age, race, sex group which differed from the average was defined as the "institutional population" for projection purposes. This portion of the population was not aged. Instead, it was assumed that this institutional population would remain constant or would change according to a projected rate of growth. For this set of projections, it was assumed that the population of military installations, state prisons and hospitals, and private colleges would tend not to grow during the 1980's; state universities would grow only at the rate defined by the University of North Carolina's Long Range Plan. No growth was assumed for these institutions for the 1990's.

The counties which have at least one age, race, sex group which was in part defined as institutional are: Avery, Burke, Craven, Cumberland, Currituck, Durham, Edgecombe, Franklin, Granville, Guilford, Harnett, Hertford, Hoke, Jackson, Macon, Madison, Northamption, Onslow, Orange, Pasquotank, Pitt, Rowan, Stanly, Transylvania, Wake, Watauga, Wayne and Wilson. In most of these counties, the institutional effects are limited to the 15-24 age group.

MIGRATION ASSUMPTIONS

The county projections have been adjusted for an anticipated level of migration for the state as a whole by controlling the sum of the counties to an independently generated state projection. The differences between the sum of the counties and the state control were distributed proportionate to each county's projected migration. The state projection utilized 1970-80 migration trends which were developed after adjustment of the 1970 and 1980 Censuses for under/over count by age, race, and sex estimated at the state level. In absence of such estimates at the county level, the state level control was used to adjust counties to some degree for the undercount problem.

Estimates and, therefore, projections of migration can be heavily influenced by errors in census enumeration. Since migration is usually calculated as a residual, all estimation errors are lumped into the estimates of migration. This can be demonstrated from the traditional demographic equation for population:

$$\textbf{Population}_{t2} = \textbf{Population}_{t1} + \textbf{Natural Increase}_{t1\ to\ t2} + \textbf{Migration}$$

In this equation, Natural Increase and Migration actually represent:

$$\begin{aligned}\textbf{Population}_{t2} = \textbf{Population}_{t1} &+ \textbf{(Births - Deaths)}_{t1\ to\ t2}\\ &+ \textbf{(True Migration + Error)}\end{aligned}$$

Where: t1 = prior time period and
t2 = current time period

An estimate of migration for the 1970's decade will be influenced by under/over count in the 1970 and the 1980 Censuses and by errors in reporting of births or deaths for the decade. The Census Bureau estimates that North Carolina's under count in 1970 was about 3 percent, slightly higher than the national average (2%) and following the pattern of the South in general.[1] These rates were substantially higher for nonwhites and for certain age groups. Since no state specific under/over count rates were available for the 1980 Census and the severity of the problem was not suspected to be as great, it was assumed that North Carolina would follow national patterns. Based on preliminary analysis of post-enumeration results at the state level, this assumption appears to be valid.

Correcting for Census errors increases migration for the 1960's while decreasing migration for the 1970's. Based on these adjustments, North Carolina experienced positive net migration of 4.7% between 1970 and 1980, with specific rates differing by age, race, and sex groups. This projections series assumes approximately the same rates of net migration for future decades as the 1970's experience revealed. Population estimates for 1983 tend to support the assumption that this rate would continue into the 1980's.

MIGRATION DEFINITION

The users of this publication should note that migration rates can be calculated in several different ways, two of which have been used in the development of projections contained within this report. These will be described briefly in this section.

The most familiar technique divides the number of migrants for a decade by the population at the beginning of a decade (Migration Rate 1). Under this technique, migration is a residual, being calculated from population and vital statistics. In this case, vital statistics reflect births and deaths to the base population as well as to migrants entering or leaving the state during the decade.

$$\textbf{Migration 1} = \textbf{Population}_{t2} - \textbf{Population}_{t1} \; \textbf{(Births - Deaths)}_{t1 \text{ to } t2}$$

$$\textbf{Migration Rate 1} = \textbf{Migration 1} \div \textbf{Population}_{t1}$$

Where: t1 = prior time period and
t2 = current time period

[a] MIGRATION RATE 1 = MIGRATION/POPULATION AT BEGINNING OF DECADE

[b] MIGRATION RATE 2 = (POPULATION AT END OF DECADE - COHORT SURVIVED)/COHORT SURVIVED

This type of rate was used in developing the projected state level controls and has been referenced in the Migration Assumptions section and quoted in Table 3 under Migration Rate 1.

An alternative approach to estimating migration takes the full effect of migration (that is, migrants plus births and deaths to migrants) and divides it by the "survived population" at the end of the decade. The survived population reflects the population at the end of the decade which would be expected given the same fertility and mortality assumptions experienced or projected in the absence of any in- or out-migration.

$$\textbf{Migration 2} = \textbf{Population}_{t2} - \textbf{Survived Population}_{t2}$$

$$\textbf{Migration Rate 2} = \textbf{Migration 2} \div \textbf{Survived Population}_{t2}$$

Where: $t1$ = prior time period and
$t2$ = current time period

Migration rates calculated according to this procedure are displayed for comparison purposes also in TABLE 3 as well as in all tables in the State, County and Metropolitan Population Summaries following this text. These rates, in general, are slightly lower than rates calculated by the first method referenced, since the loss in population due to deaths is greater than the gain in population due to births during a decade. Thus, both the numerator and, more importantly, the denominator in the migration rate equation is smaller. For both approaches, Migration 1 and 2, migration reflects the net effect of both in- and out-migration.

Because of the different techniques for calculating migration rates, users should exercise care in comparing migration rates within this document and with other sources.

FERTILITY ASSUMPTIONS

The Total Fertility Rate (TFR) is defined as the number of children a woman would bear during her lifetime if she had children at the current pattern of age-specific fertility rates for all of her childbearing years. North Carolina's current fertility rate is lower than the nation as a whole. It is assumed that this relationship to the nation will remain in future decades while fluctuating with national trends. National fertility projections reflect the middle range series developed by and used in the Census Bureau's national population projections.[2] They assume that fertility by race will converge by 2050 at 1.9. Under these assumptions and holding the state's relationship to the nation in 1980 constant, North Carolina Fertility rates would also converge

---

2000	.002700	.074630	.117310	.102190	.061080	.024740	.004480	.000100	1.9362

at about 2050, but at a somewhat lower level - 1.6 children versus 1.9 for the for the nation. With a continuation of current trends, both white and nonwhite women today will complete their families in the future with less than two children on average - whites having about 1.5 children and nonwhites having about 1.9 children.

Births for each county were estimated using annual state level age - race specific birth rates adjusted for the historical relationship between the county's rate and the state's rate. Birth rates for 1970-1982 are based on actual data; rates for 1983-2000 are projected.

MORTALITY ASSUMPTIONS

Assumptions regarding future mortality were developed using new state life tables for 1979-81. These were prepared by the North Carolina Office of State Budget and Management using the same techniques employed by the National Center for Health Statistics in creating the 1969-71 State Life Tables.[3] Actual North Carolina births and deaths for 1979-81 were used in the construction of the North Carolina Life Tables for all age groups up to 85. National survival rates for ages 85 and over were used due to the unreliability of state level data resulting from the small number of older adults in the upper ages.

It is assumed that mortality for North Carolina will converge to the national average by 2050. National mortality rates reflect those developed by the Census Bureau for its national population projections. According to these projections and, thus, the North Carolina projections, by 2050 race differences in mortality are assumed to disappear but sex differences will still remain. The assumed ten year survival rates for North Carolina used in this series of projections appear in Table 5.

USER NOTES

Detailed population estimates and projections for the state and total estimates and projections for counties are presented in this publication. Users should recognize that all projections have an element of uncertainty. These county projections are based upon trends which prevailed between 1970 and 1980 as determined by age, race and sex totals in the 1970 and 1980 census. In addition, there are slight differences in the classification of persons by race between the 1970 and 1980 censuses. These projections are accurate to the extent that the census counts are accurate in both decades and to the extent that trends continue as they have in the recent past. These projections present a "middle" series that represents a "most likely" scenario for future state growth. The presentation of state and county figures in unrounded form does not imply that they are accurate to the last digit. The smaller the population component projected, the greater the probability of error. Estimates for small age-race-sex groups or small counties are more subject to error than those for larger groups and counties. Lastly, projections for counties with large military populations are frequently volatile due to the impact of changes in U.S. military policy.

PROVISIONAL ESTIMATES OF THE POPULATION OF NORTH CAROLINA COUNTIES
July 1, 1983

This report presents provisional population estimates for North Carolina and its counties as of July 1, 1983. These estimates were prepared through the Federal State Cooperative Program for Local Population Estimates. The objective of this program is the development and publication of yearly population estimates for counties using uniform procedures standardized for data input and methodology. The estimates shown here were prepared jointly by the Bureau of the Census and the Office of State Budget and Management, the agency designated by the Governor to work with the Bureau of the Census in implementing and carrying out the objectives of the Federal-State Cooperative Program for Local Population Estimates. These estimates will be published in rounded form in Current Population Reports, Series P-26 later this year.

The methods used to prepare these estimates were selected jointly by North Carolina and the Bureau of the Census. A variety of methods was tested against the 1980 census. Then, based on these test results, the most appropriate methods were selected specifically for North Carolina. For most states, including North Carolina, the best estimates were obtained from an average of the estimates produced by the Ratio-Correlation method and those produced by the Administrative Records method. For a more overall estimates program, see Series P-26. An analysis will be published soon in Current Population.

The county estimates shown for July 1, 1983 are based on an average of the following methods:

1. **The Regression (Ratio-Correlation) method.** In the Regression method, a multiple-regression equation is used to relate changes in the distribution of a number of different data series to changes in the distribution of population among counties. For both the development of the regression equation and the computation of the population estimates, the data for all variables are transformed by calculating ratios of percentage shares in the later year to corresponding percentage shares in the earlier year. These transformations cause the resulting coefficients in the prediction equation to add approximately to 1.0. The series of data used in the Regression method for North Carolina are

BEST AVAILABLE COPY

Federal income tax returns (X1), school enrollment in grades 1 through 8 (X2), and automobile registrations (X3). The regression equation for North Carolina is given by

$$y = 0.019 + 0.296(X1) + 0.336(X2) + 0.385(X3)$$

2. **The Administrative Records method.** This is a component method that uses Federal tax data to measure the net intercounty migration of the nongroup quarters population under 65 years old, reported resident birth and death statistics to estimate net natural change, and data on Medicare enrollees to estimate the population 65 years old and over. Tax data are used in the base year and the estimate year to determine the number of persons whose county of residence changed during the period. A net migration rate based on exemptions claimed by the matched cases is applied to the nongroup quarters population under 65 years old. These estimates of migration are then combined with the independent estimates of the population 65 years old and over, inmates of institutions, college students in dormitories, military personnel living in barracks, and the other components of population change (births, deaths, immigration from abroad, and net movement between the military and civilian population) to yield an overall estimate of the total population. The estimates shown in this report were developed by averaging estimates based on the above-cited independent methods and controlling the averaged estimates to the State estimate for North Carolina.

The 1980 census populations for the State and counties reflect corrections made through July, 1984. The births and deaths are based on reported vital statistics for calender years 1980, 1981, 1982, and 1983. Each total was made by adding 3/4 the value for 1980, the entire values for 1981 and 1982, and 1/2 the value for 1983. Net migration is the residual difference between net total change and natural increase.

Estimates of the Population of North Carolina Counties: July 1, 1983
